

Subreddit Classification with Natural Language Processing

By: Micah Luedtke

Problem:

- **Quantitative:** Can word frequency and usage be used to predict where a reddit post came from the r/Linguistics (1) or the r/LanguageLearning (0) subreddits?
- **Qualitative:** What insights can we gain from the difference in keywords between two different groups studying language in different ways?

Two types of linguists:

- **Someone who speaks another language:** r/LanguageLearning is a subreddit where people ask questions and share advice about effectively learning other languages
- **Someone who studies linguistics:** r/Linguistics is a subreddit where people discuss various topics related to the structure of different languages

Web Scrapping and Data Cleaning:

```
In [19]: #Function for pulling
def pull_merge(subreddit_1, subreddit_2, posts=100):
    '''Default for posts is 100, maximum request is 1000 posts'''
    headers = {'user-micah': 'my-user-micah'}
    url_1 = "https://api.pushshift.io/reddit/search/submission/?subreddit="+subreddit_1+"&size="+str(posts)
    url_2 = "https://api.pushshift.io/reddit/search/submission/?subreddit="+subreddit_2+"&size="+str(posts)
    res_1 = requests.get(url_1, headers=headers)
    res_2 = requests.get(url_2, headers=headers)
    df_subreddit_1 = pd.DataFrame(res_1.json()['data'])
    df_subreddit_2 = pd.DataFrame(res_2.json()['data'])
    df = df_subreddit_2.append(df_subreddit_1, sort=False)
    df.to_csv('{} and {}'.format(subreddit_1, subreddit_2)+str(datetime.datetime.now()))
```

```
In [4]: key_columns= ['author', 'created_utc', 'num_comments', 'permalink',
                      'score', 'selftext', 'subreddit', 'title']
```

```
In [5]: df.drop(df.columns.difference(key_columns), 1, inplace=True)
```

BONUS: Constructed Languages

- Constructed languages are languages that were constructed by a single person or small group relatively quickly, rather than over time by natural languages development processes.
- r/Conlangs is dedicated to people interested in creating constructed languages and discussing methods.
- Ran a sample of r/Conlangs through each of the models and the posts were classified as r/Linguistics 65%-75% of the time.

Conclusions and Future Work:

- **People interested in linguistics and language learning approach similar subject matter from different perspectives**
- **Direct comparisons between r/LanguageLearning & r/Conlags and r/Linguistics & r/Conlags**
- **User-level comparison**
